

ATM Transaction System

Problem Description

You are given a simple ATM system that maintains an account balance. The system supports deposit, withdrawal, and balance inquiry operations. After processing each query, you must print the current status of the account. All operations must be implemented using separate functions.

Input

The first line contains an integer B — initial balance.

The second line contains an integer Q — number of queries.

Each of the next Q lines contains a query:

1 $x \rightarrow$ Deposit amount x

2 $x \rightarrow$ Withdraw amount x

3 $\rightarrow$ Check balance

Output

After each query, print:

Balance: B

If withdrawal fails:

Insufficient Balance

Balance: B

Constraints

$1 \leq Q \leq 1000$

$0 \leq B, x \leq 10^9$

Required Functions

`void deposit(long long *balance, long long amount);`

`void withdraw(long long *balance, long long amount);`

`void showBalance(long long balance);`
